Computational approaches for guiding rational vaccine design:

Case studies in HCV, HIV, and COVID-19

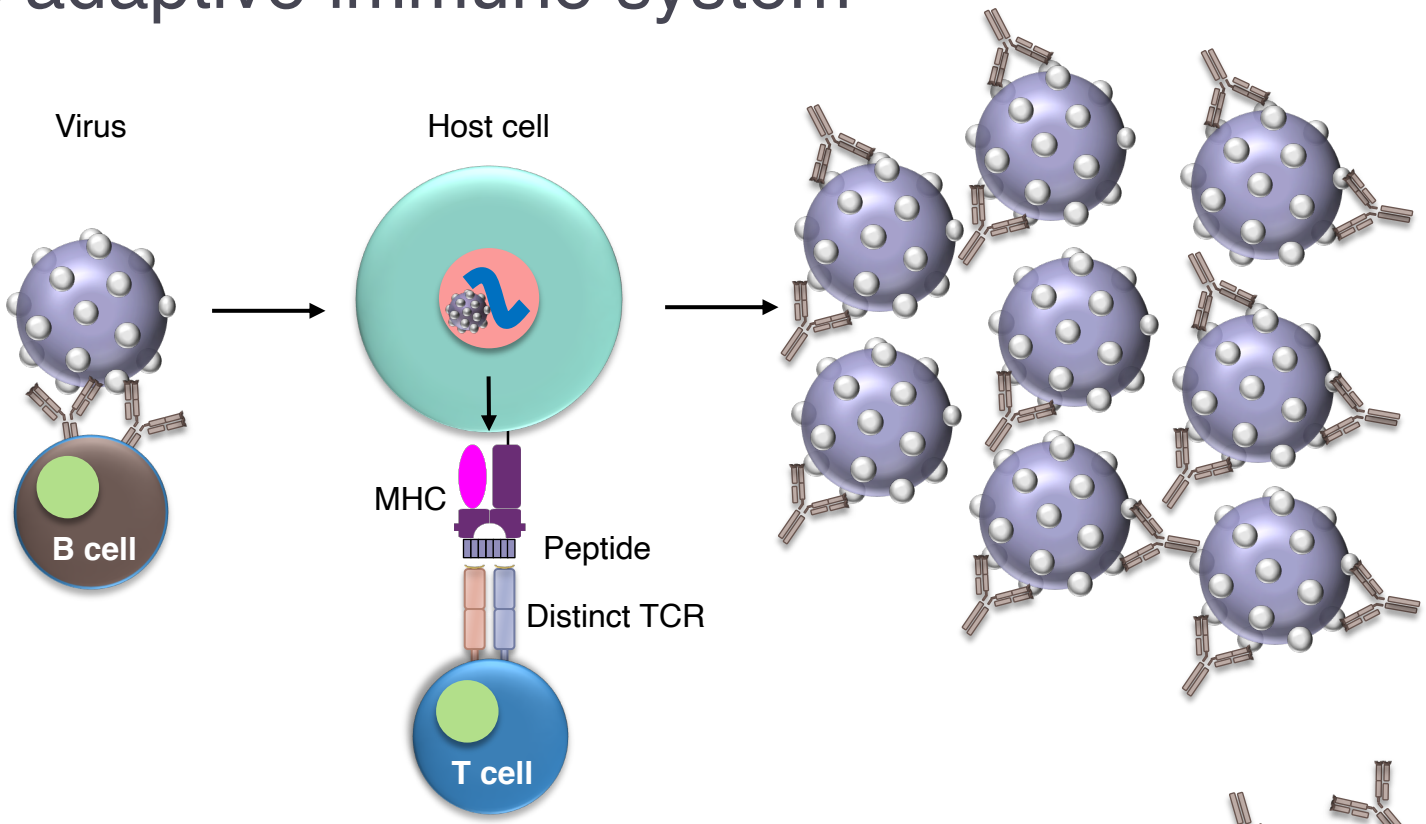
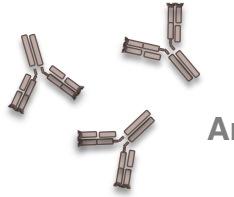
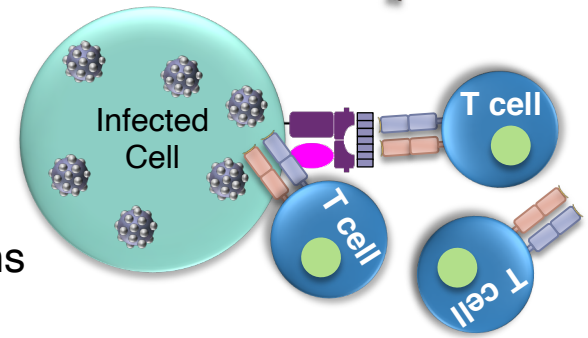
AND TECHNOLOGY

Pathogen specific adaptive immune system



Basis for vaccination





Memory of past infections

Vaccination

- Eradication or near-eradication of diseases such as smallpox and polio
- Still no effective vaccine against many pathogens
- Main focus of today's talk: **Hepatitis C virus (HCV), SARS-CoV-2, and a bit about HIV**

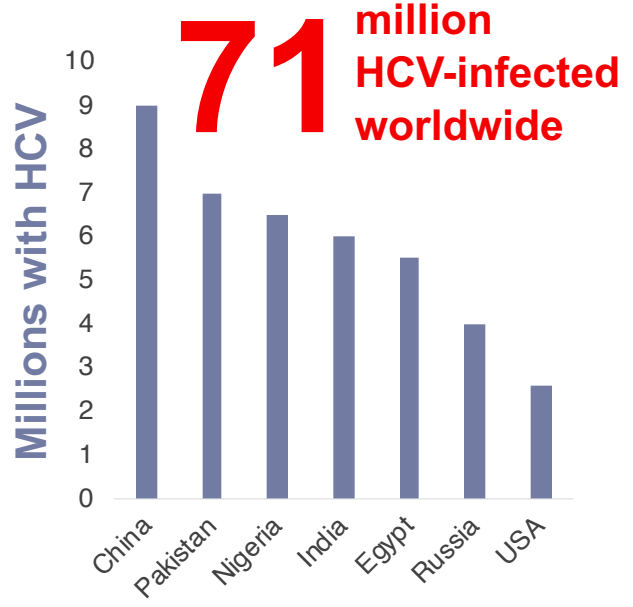
…. and …

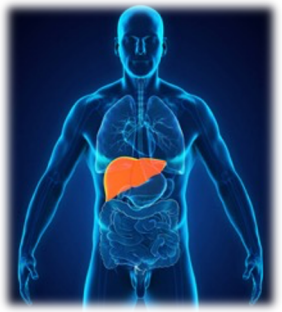
How data analytics, modelling, and statistical inference can help?

PART 1: Identifying escape-resistant antibodies for guiding HCV vaccine design

Hepatitis C virus

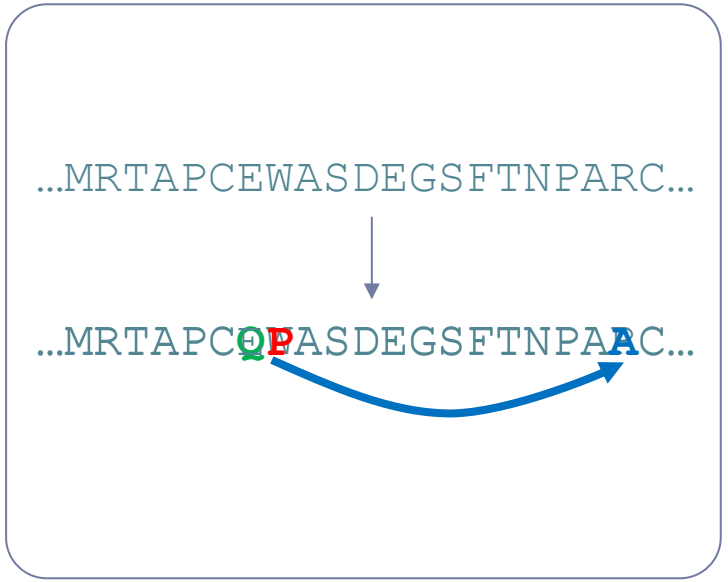
- Global public health problem
- Around 20–30% of infections are asymptomatic and resolve within 6 months
- A leading cause of liver transplants and liver cancer
- Key challenges in HCV vaccine development:
  - High replication rate (~10^{12} copies per day)
  - High mutation rate (~10^{-4} mutations/nucleotide/replication cycle)
- Effective new drugs available, but problem still not fully solved
- Widespread vaccination would play a key role in eradicating HCV

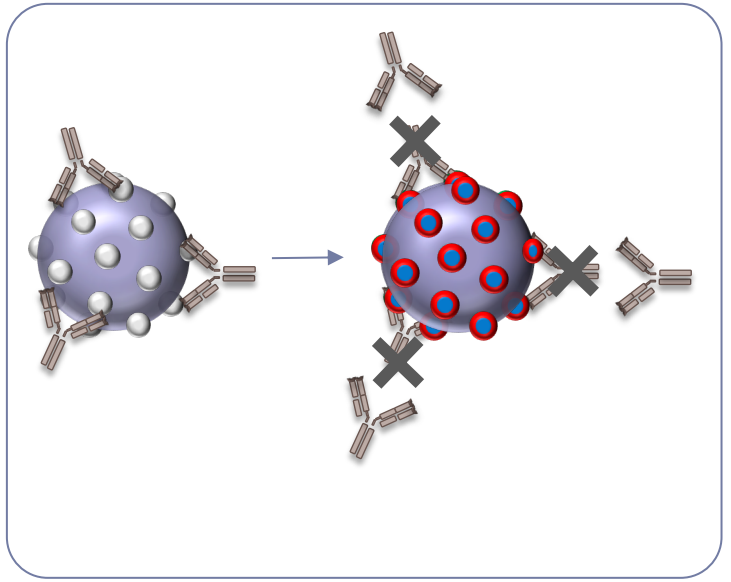


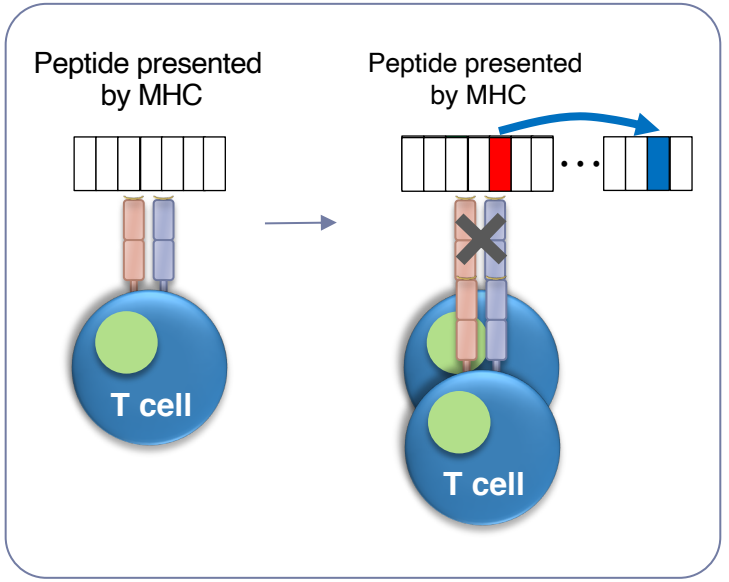


Immune system evasion by HCV

Key Point: Mutations generally do **not** act independently







HCV mutation during replication

High mutation rate of HCV results in immune escape if the mutant virus has a **high fitness**

Additional complication

Compensation of **deleterious** effect of individual mutations

Problem statement

- **E2-specific broadly neutralizing human monoclonal antibodies (HmAbs)** have been identified for HCV
  - Spontaneous clearance associated with their early appearance ✓
  - Escape mutations have been observed experimentally ✗

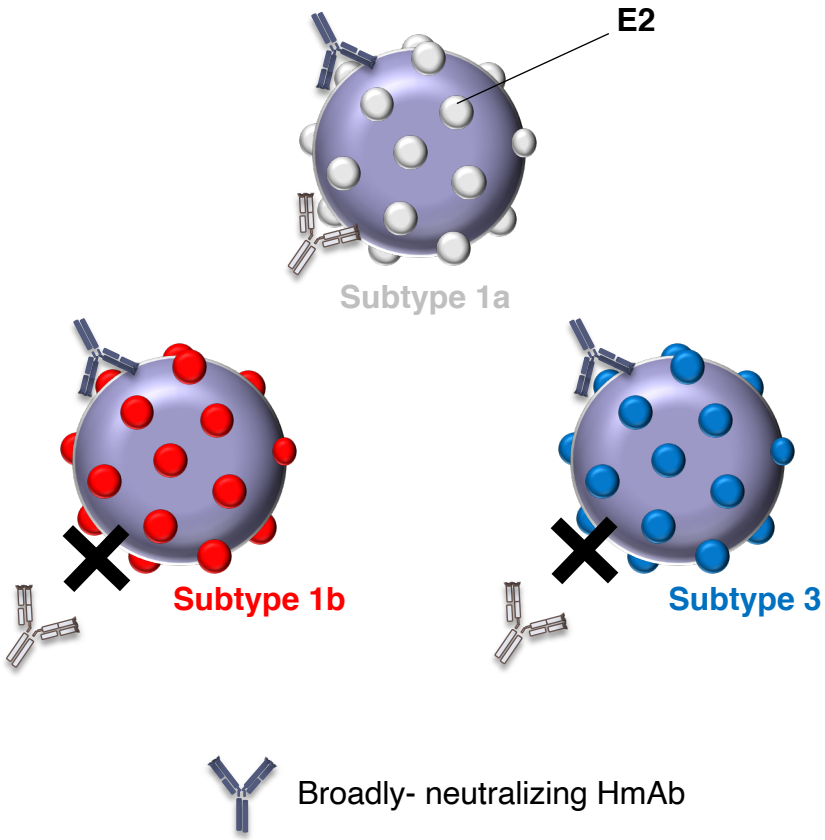
Key open question:

How “broadly-neutralizing” are the identified HmAbs?

Which ones are the most difficult to escape?

Proposed strategy:

Use **sequence data of E2, statistical modeling and inference** to try to identify escape-resistant HmAbs that can aid HCV vaccine development



Quadeer, Ahmed A. et al. “Identifying immunologically-vulnerable regions of the HCV E2 glycoprotein and broadly neutralizing antibodies that target them”, *Nature Communications* 10 **(2019)**

3,363 sequences of
363 residues long E2 protein extracted
from **1,298** HCV-infected individuals
(subtype 1a)

Statistical model:
Maximum entropy (prevalence) model

Fitness Prevalence

$$f(\mathbf{x}) \sim p(\mathbf{x}) = \frac{\exp[-E(\mathbf{x})]}{Z}$$

$$E(\mathbf{x}) = \sum_{i=1}^{L} h_i(x_i) + \sum_{i=1}^{L} \sum_{j=i+1}^{L} J_{ij}(x_i, x_j), \quad Z = \sum_{\mathbf{x}'} \exp[-E(\mathbf{x}')]$$

Maximum entropy formulation

$$\max S = -\sum_{\mathbf{x}} p(\mathbf{x}) \log p(\mathbf{x})$$

$$\text{s.t.} \sum_{\mathbf{x}} p(\mathbf{x}) = 1$$

$$\sum_{\mathbf{x}} p(\mathbf{x}) \delta(x_i, a) = p_i^{obs}(a)$$

$$\sum_{\mathbf{x}} p(\mathbf{x}) \delta(x_i, a) \delta(x_i, b) = p_{ij}^{obs}(a, b)$$

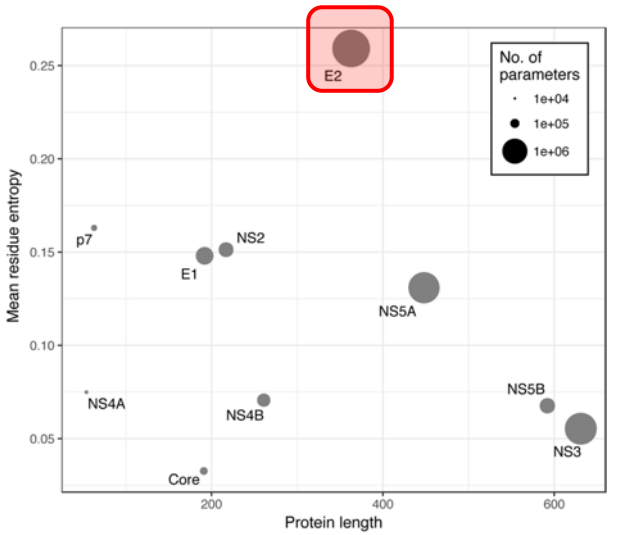
Solution:

$$(\mathbf{h}^*, \mathbf{J}^*) = \arg\min_{\mathbf{h},\mathbf{J}} \mathrm{KL}\,(p_0 \,||\, p_{\mathbf{h},\mathbf{J}})$$

Challenge:
Huge number of parameters



HCV sequence data → Maximum entropy model → Predicted fitness

Framework for model inference

$$(\mathbf{h}_{\mathrm{MPF}}, \mathbf{J}_{\mathrm{MPF}}) = \arg\min_{\mathrm{h,J}} \mathrm{KL}(p_0 || p_{\mathrm{h,J;t}}) + \lambda_1 |\mathbf{J}|_1 + \lambda_2 |\mathbf{J}|_2$$

$$\mathrm{KL}(p_0 || p_{\mathrm{h,J;t}}) \approx \sum_{b,i,a} \exp\left(\frac{1}{2}\left(\left(2y_{b,(i-1)L+a} - 1\right)\sum_{j,b} y_{b,(j-1)L+b} J_{ij}(a,b) - h_i(a)\right)\right)$$

PART 2:
Finding vaccine targets for COVID-19

SARS-CoV-2 and vaccine design

- Comparison of recent coronavirus infections in humans
  - SARS-CoV (2003 – 2004)[1]
    Infections: 8,098; Deaths: 774; Case-fatality rate: 15%
  - MERS-CoV (2012 –)[2]
    Infections: 2,494; Deaths: 858; Case-fatality rate: 34.4%
  - SARS-CoV-2 (2019 –)[3]
    Infections[4] : **>7,000,000**; Deaths : **>400,000**; Case-fatality rate[5] : **1.4%**

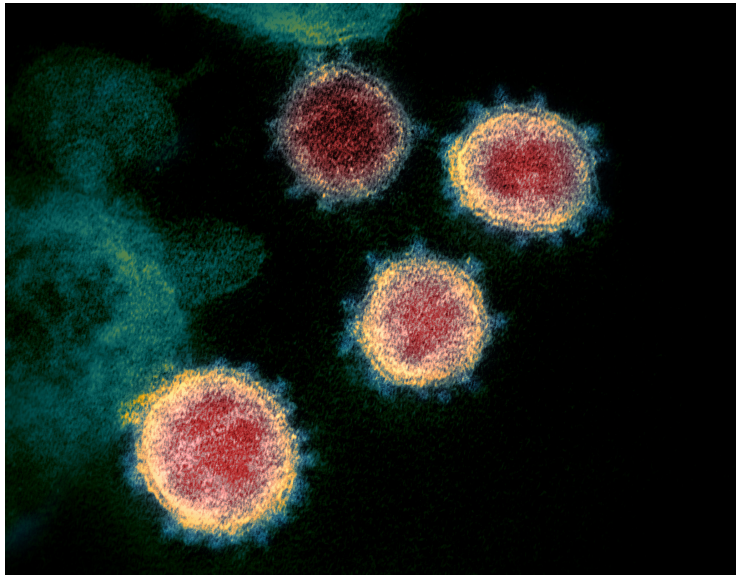

Image credit: NIH US

- Clear need for an effective vaccine
- **Our goal:** help guide vaccine design by presenting early vaccine target recommendations
- Seek to *identify which parts of the virus may elicit a protective immune response?*
- Challenged by a lack of knowledge of SARS-CoV-2

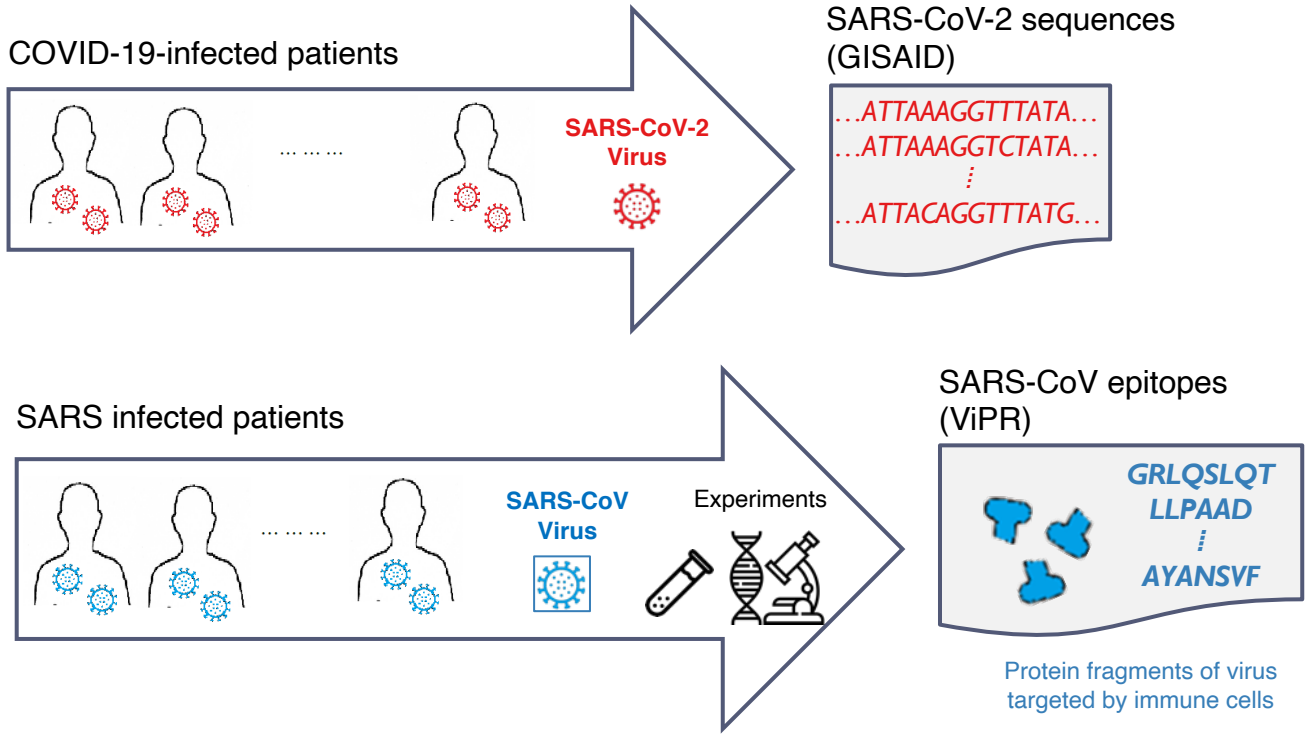
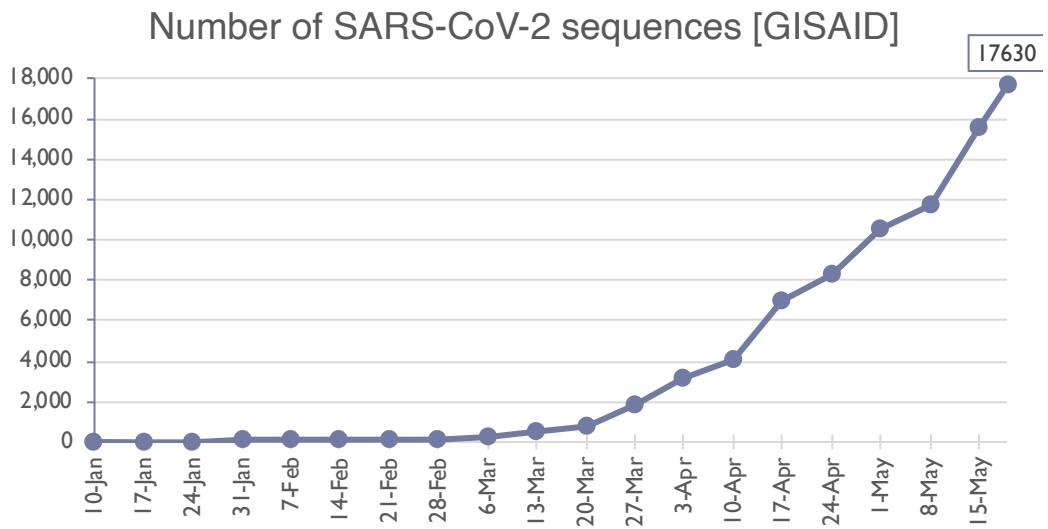
Providing SARS-CoV-2 vaccine target recommendations



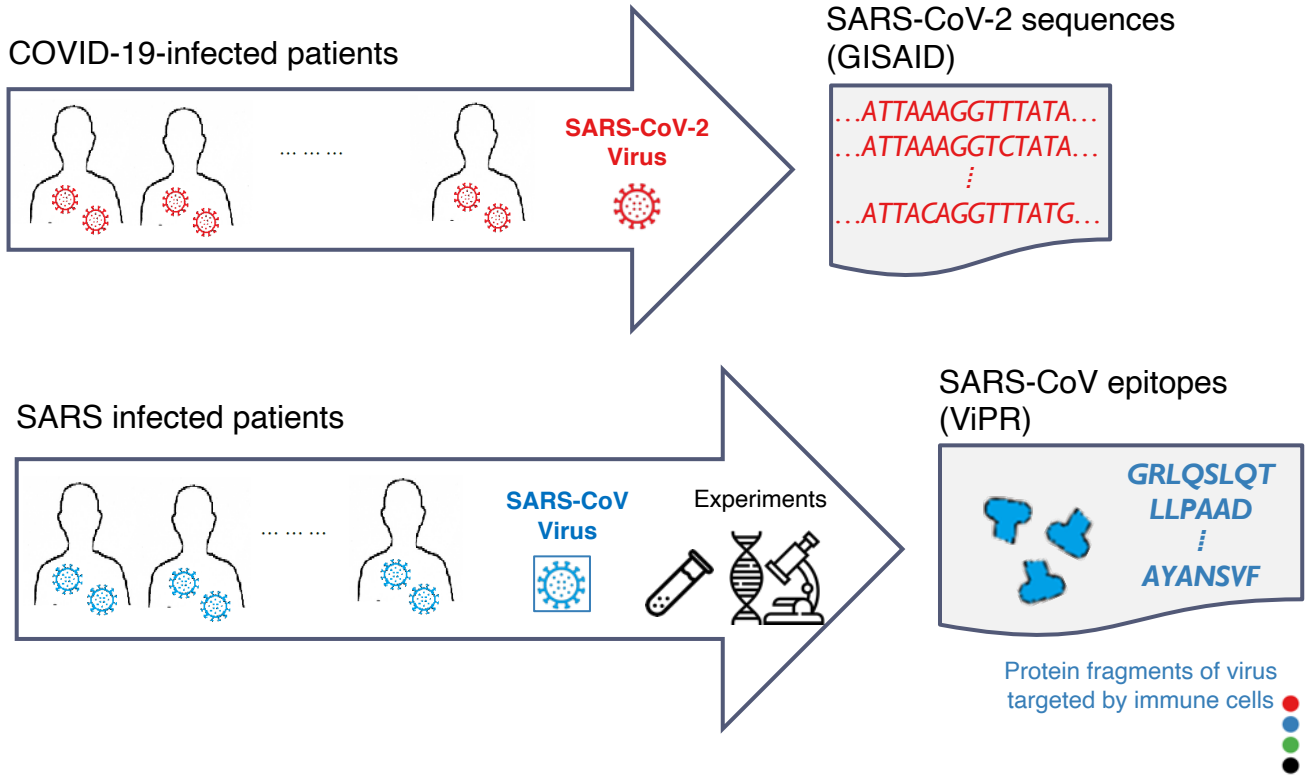


Percentage sequence identity with SARS-CoV-2

	S protein	N protein	M protein	E protein
SARS-CoV	76.0%	90.6%	90.1%	94.7%
MERS-CoV	29.4%	45.9%	39.2%	34.1%

Ahmed, Syed F. et al. "Preliminary identification of potential vaccine targets for the COVID-19 coronavirus (SARS-CoV-2) based on SARS-CoV immunological studies." *Viruses* 12 (**2020**).

Providing SARS-CoV-2 vaccine target recommendations



Idea

Exploit **immunological data for SARS-CoV** to provide vaccine target recommendations for SARS-CoV-2

Approach

Search for SARS-CoV epitopes with a **close genetic match** in SARS-CoV-2 sequences

Output

Potentially **immunogenic** epitopes

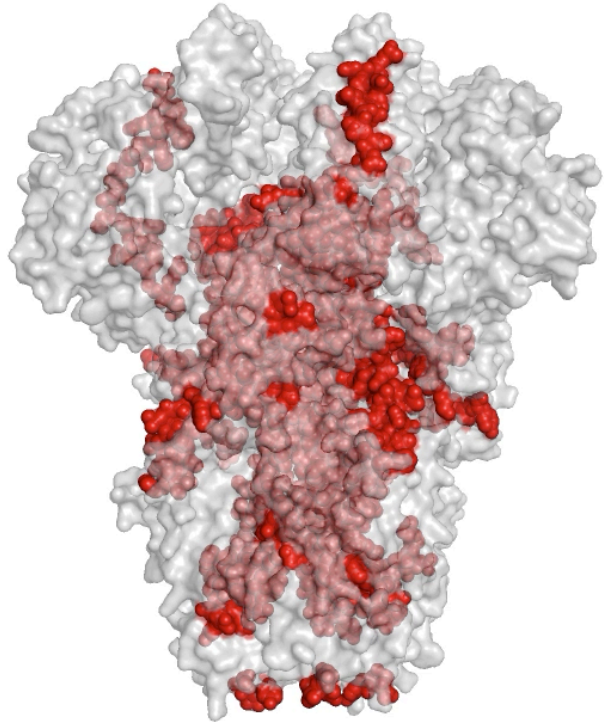
Ahmed, Syed F. et al. “Preliminary identification of potential vaccine targets for the COVID-19 coronavirus (SARS-CoV-2) based on SARS-CoV immunological studies.” *Viruses* 12 (**2020**).

Results summary

SARS-CoV epitopes	Percentage with identical genetic match in SARS-CoV-2
T cell epitopes	**24%**
B cell epitopes	**16%**
overall	**20%**

Identified set of T cell epitopes may provide broad population coverage globally (**96%**) as well as in China (**88%**)

B cell epitopes with an identical genetic match in SARS-CoV-2

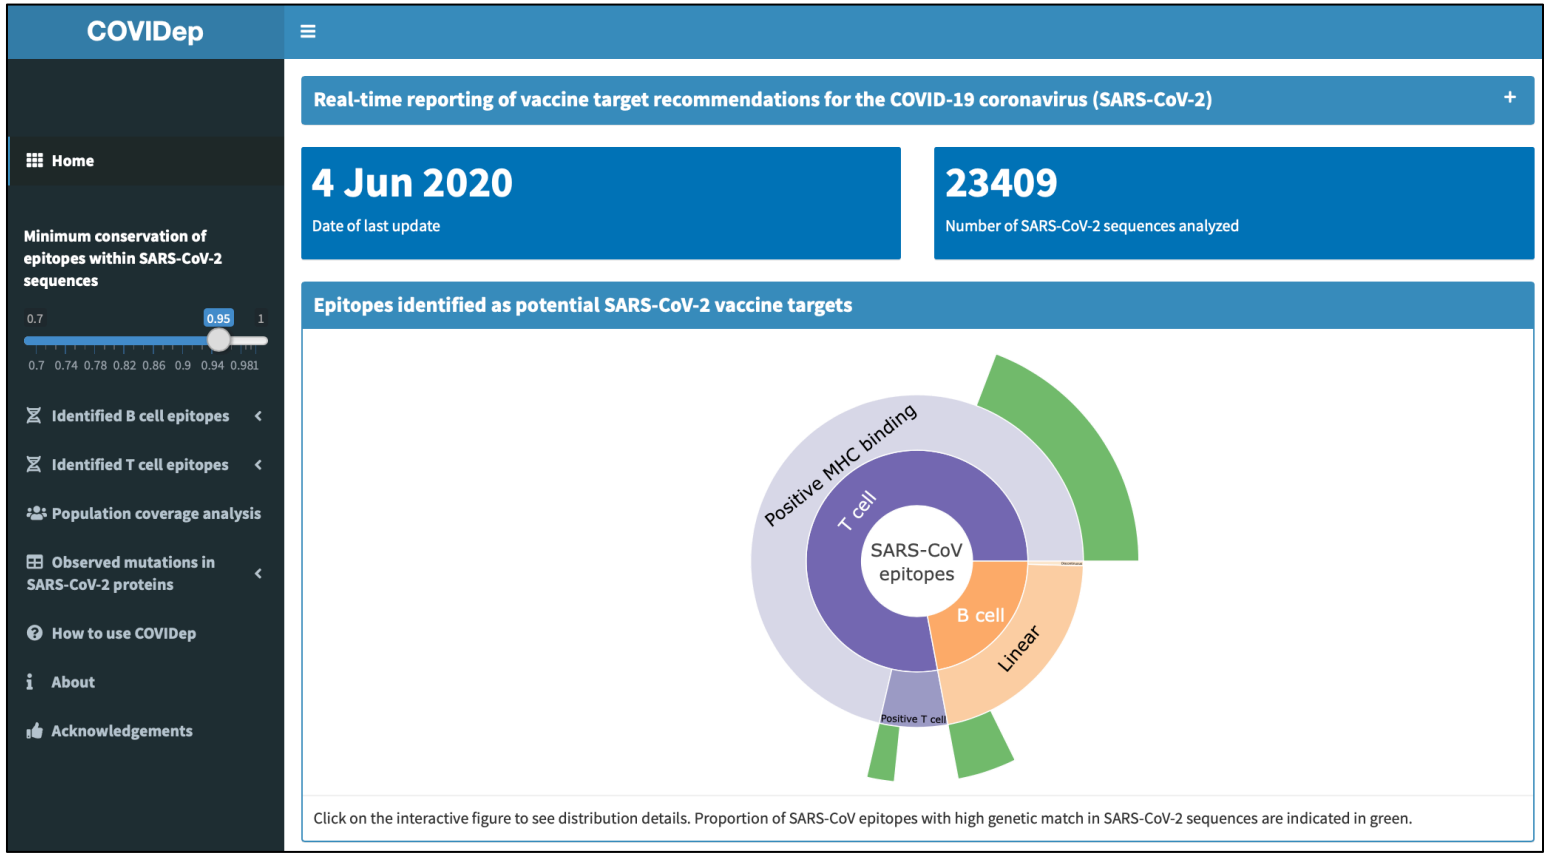


SARS-CoV spike protein
(PDB ID: 5XLR)

Ahmed, Syed F. et al. “Preliminary identification of potential vaccine targets for the COVID-19 coronavirus (SARS-CoV-2) based on SARS-CoV immunological studies.” *Viruses* 12 (**2020**).

Extension: COVIDep https://covidep.ust.hk

- Increase in number of SARS-CoV-2 sequences
  - **120 → now over 25,000**
- COVIDep: A web-based platform for real-time reporting of vaccine target recommendations for SARS-CoV-2
- Features:
  - Identification of SARS-derived B-cell and T-cell epitopes that provide vaccine target recommendations for SARS-CoV-2;
  - For T cell epitopes, it reports estimated population coverage using HLA/MHC statistical information;
  - Up-to-date reporting based on latest sequence data available (from GISAID).



Ahmed, Syed F. et al. "COVIDep: A web-based platform for real-time reporting of vaccine target recommendations for SARS-CoV-2." *to appear in Nature Protocols* (**2020**).

Connections with COVID-19 **B cell** responses and preclinical vaccine trials

- Most (24/29) identified B cell epitopes of the spike protein are in the **S2 subunit**, reported to be a main region targeted by **cross-neutralizing antibodies**

- Overlap with regions in the S1 subunit reported to be targeted by **cross-neutralizing antibodies**

- Overlap with an epitope targeted by neutralizing antibodies in a **preclinical trial of a SARS-CoV-2 vaccine candidate**

- Overlap with regions recognized by neutralizing antibodies in **recovered COVID-19 patients**

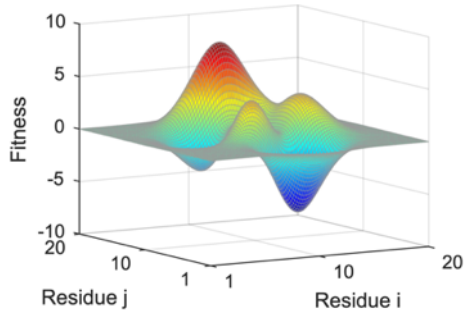
Illustration: istock

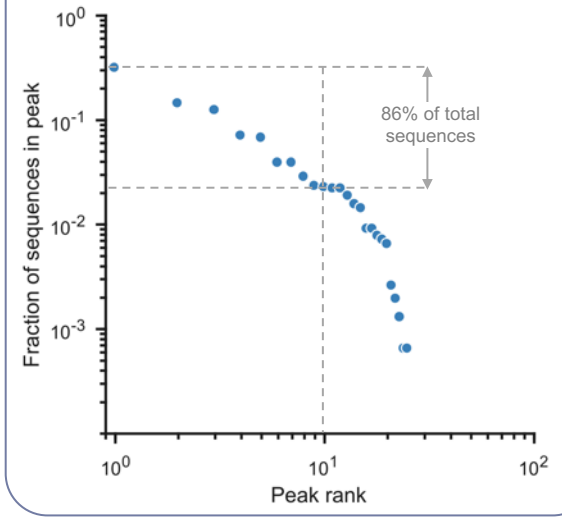
Using maximum entropy model to explore why the polio vaccine is so effective

Fitness × Prevalence

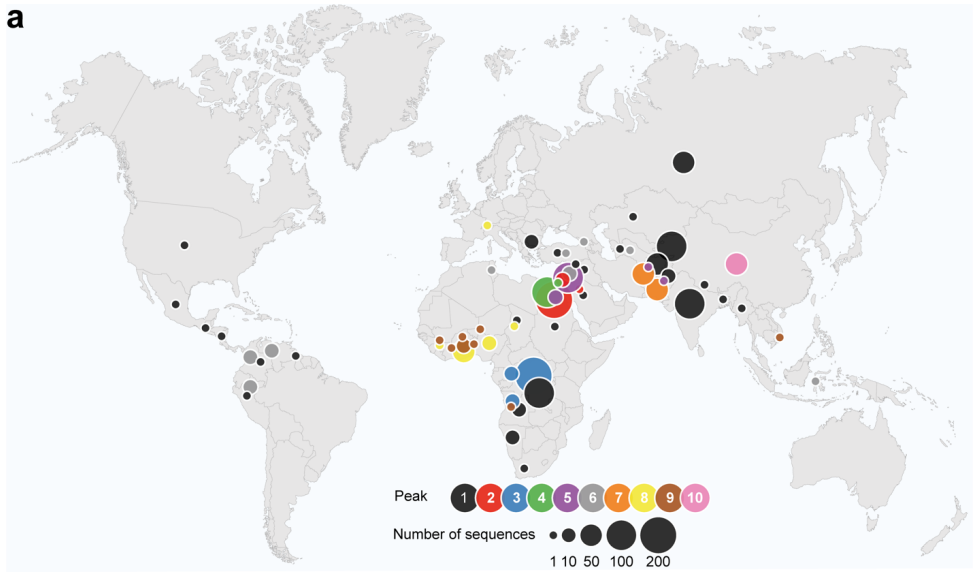
$$f(\mathbf{x}) \sim p(\mathbf{x}) = \frac{\exp[-E(\mathbf{x})]}{Z}$$

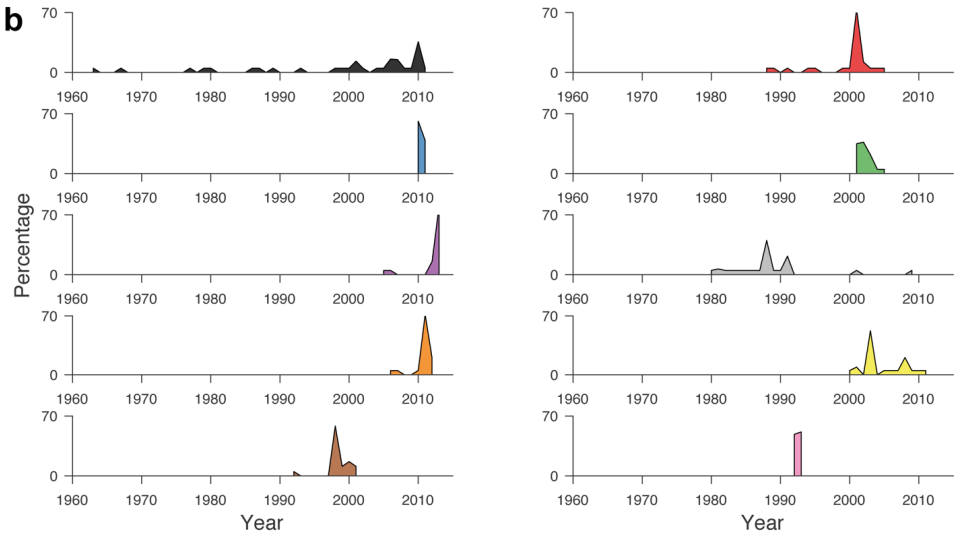
Inferred landscape comprises multiple peaks



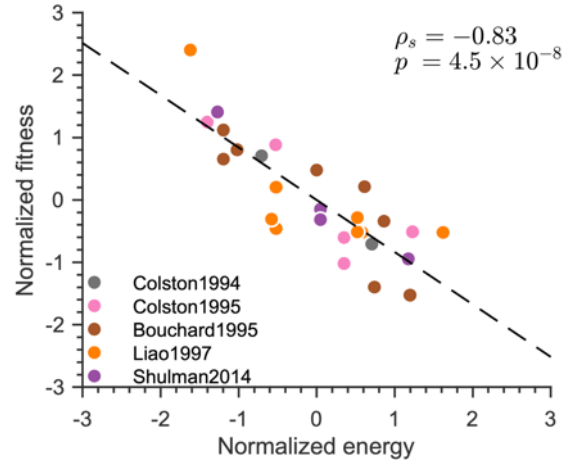


All peaks, except peak 1, reflect geographically and temporally-localized outbreaks

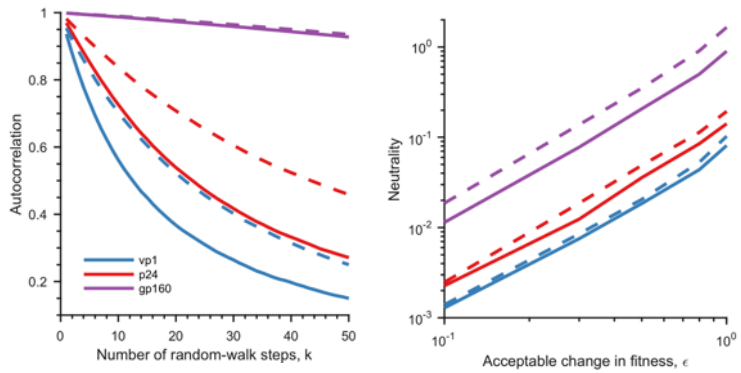




Landscape based on peak 1 reflects intrinsic fitness landscape



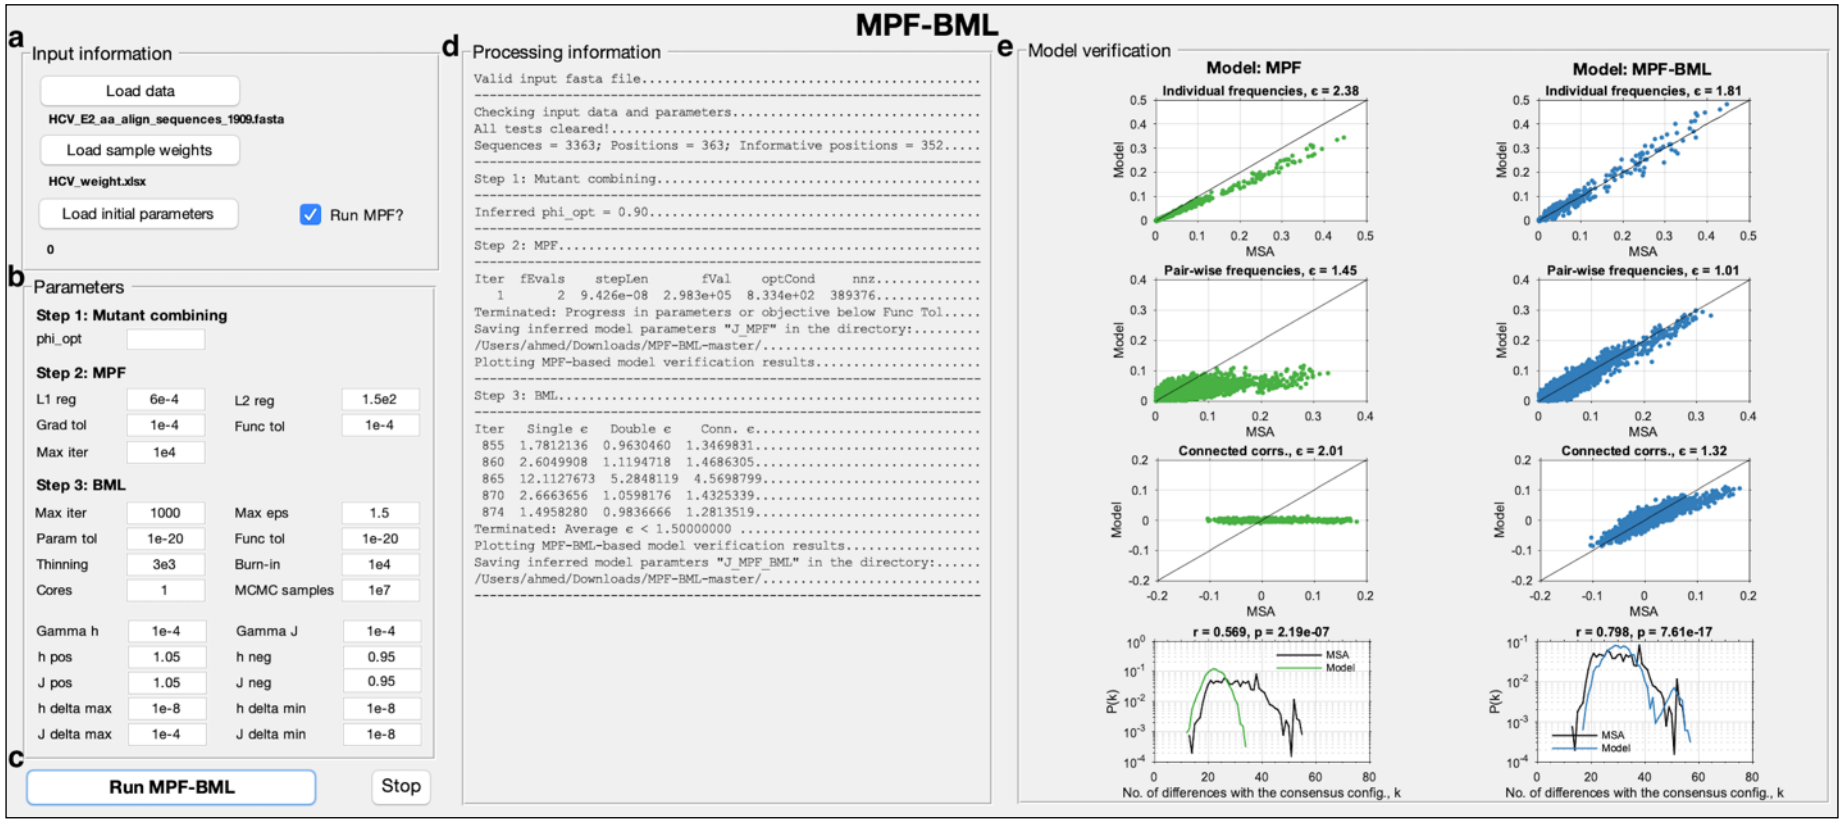
Compared to HIV proteins, PV is subject to more restrictive constraints



Quadeer, Ahmed A. et al. "Deconvolving mutational patterns of poliovirus outbreaks reveals its fitness landscape," *Nature Communications* 11 (**2020**).

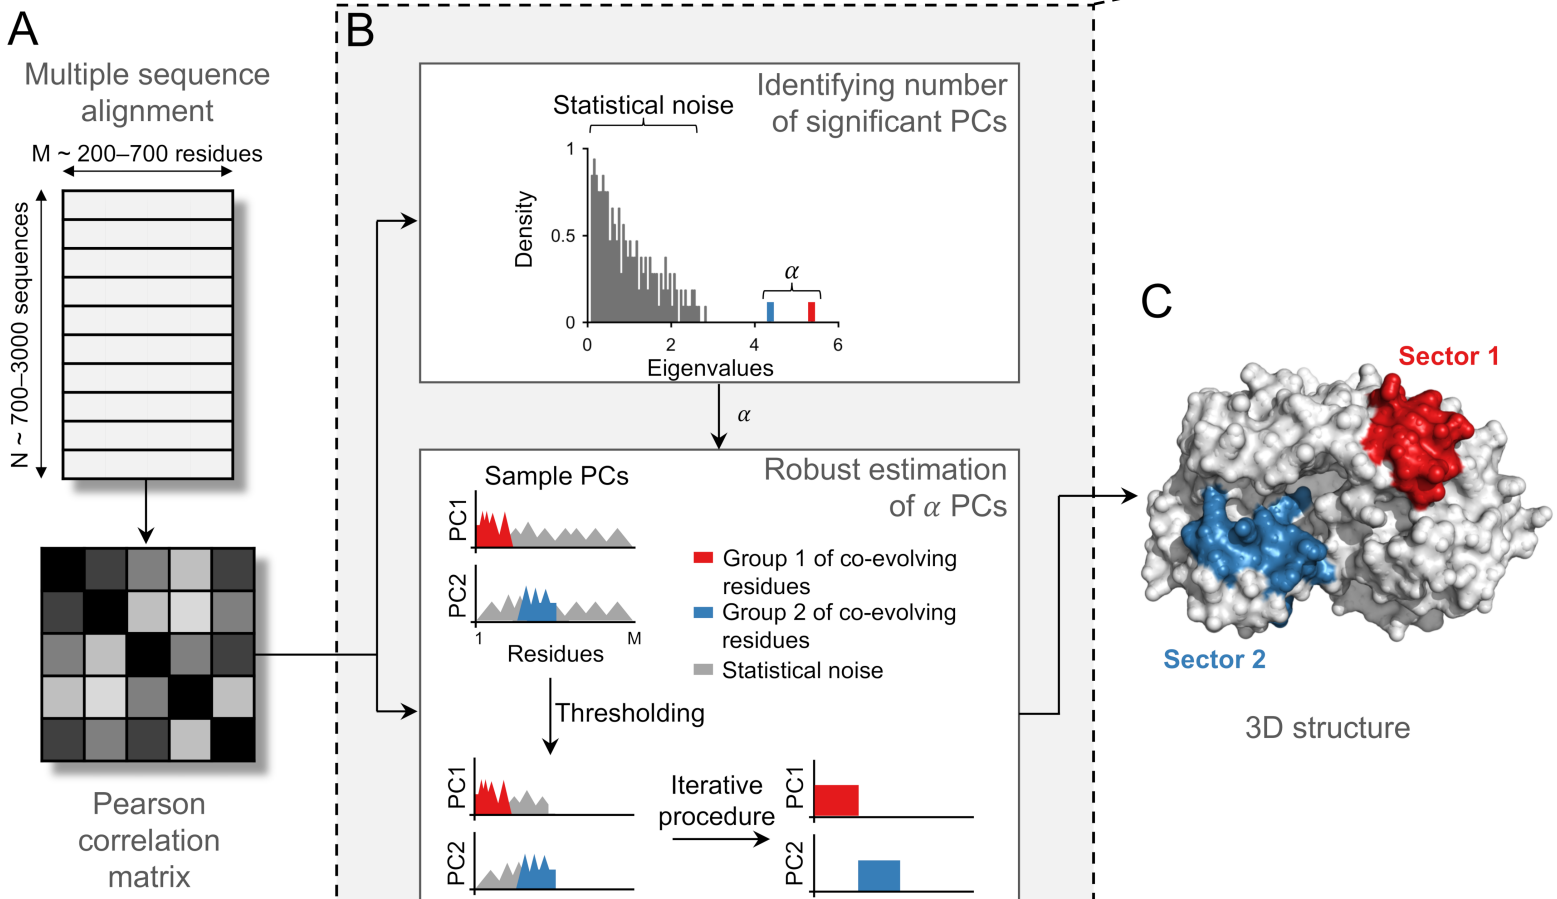
MPF-BML: A standalone GUI-based package for maximum entropy model inference

- **Standalone**—no requirement of any pre-installed application;
- **Cross-platform**—works for Windows, Linux, and mac OS;
- **GUI-based**—no knowledge of any programming language required;
- **Minimum input requirement**—only sample data and sample weights (if available) required;
- **Publication-quality figures output**—all results are saved as vector graphics.



Quadeer, Ahmed A. et al. "MPF-BML: A standalone GUI-based package for maximum entropy model inference", *Bioinformatics* 36 (**2020**).

Robust co-evolutionary analysis (RoCA) of proteins



- RMT-based sparse PCA (SPCA)
  - Pioneer work – Diagonal thresholding [Johnstone 2009]
  - Augmented SPCA [Paul 2012]
  - **Iterative thresholding SPCA (ITSPCA)** [Ma 2013]

Summary

- Based on "orthogonal iteration method"
- Estimates sparse subspace of the leading eigenvectors
- Steps involved:
  - Projecting the correlation matrix on a subspace
  - Thresholding the columns of the resultant matrix using a **thresholding** parameter
  - Repeat until convergence

Robust Co-evolutionary Analysis (RoCA)

- Adapted to work on correlation matrices
- A data-driven **thresholding** parameter designed using ideas from random matrix theory

Quadeer, Ahmed A. et al. "Co-evolution networks of HIV/HCV are modular with direct association to structure and function." *PLoS Computational Biology* 14 (**2018**).

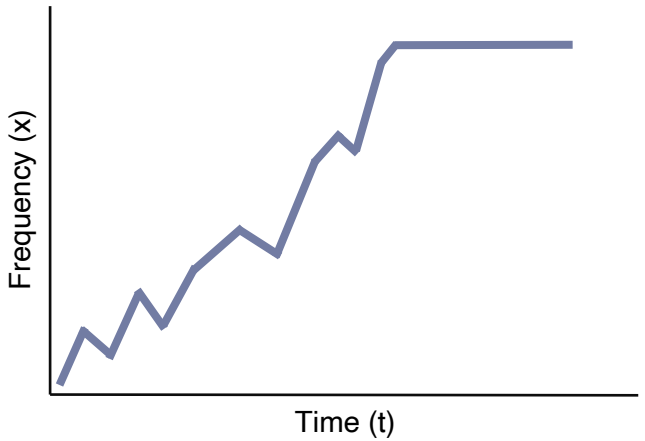
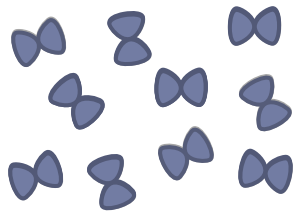
Inferring fitness based on evolutionary histories

Evolutionary history

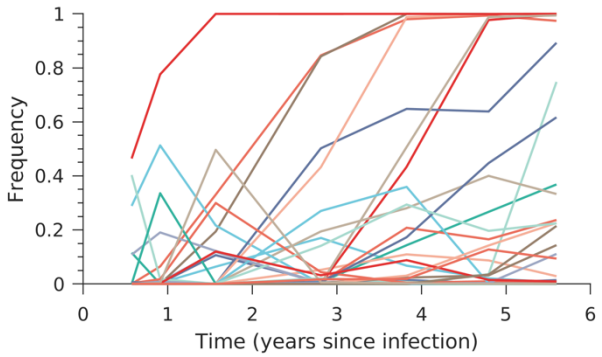




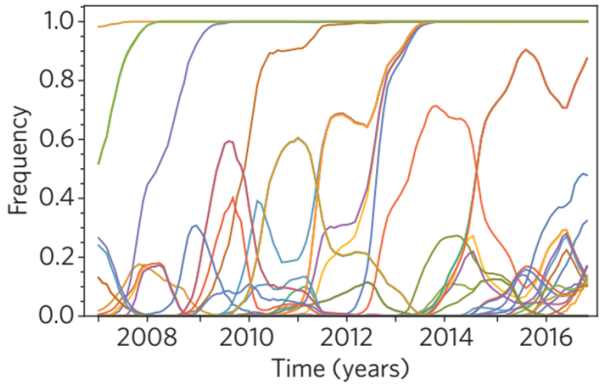
Wild-type ...CAGT... Mutant ...CATT...

Real data

HIV inpatient evolution[1]



Human Influenza global evolution[2]



Model: Wright-Fisher dynamics in the diffusion limit

Assumption: Fitness effects are additive

Evolution of mutant frequencies $\underline{x} = \{x_1, x_2, \ldots, x_L\}$ follows a **Fokker-Planck** (diffusion) equation

Drift term: expected change in mutant frequencies

$$d_i = \underbrace{x_i(1-x_i)s_i}_{\text{Selection}} + \underbrace{\sum_{i \neq j}(x_{ij} - x_i x_j)s_j}_{\text{Linked selection}} + \underbrace{(1-2x_i)\mu}_{\text{Mutation}}$$

Mutant frequency; Selection coefficient; Double mutant frequency; Mutation probability

Diffusion term: characterizes fluctuations due to the stochasticity of replication

$$C_{ij} = \begin{cases} x_i(1-x_i)/N & i = j \\ (x_{ij} - x_i x_j)/N & i \neq j \end{cases}$$

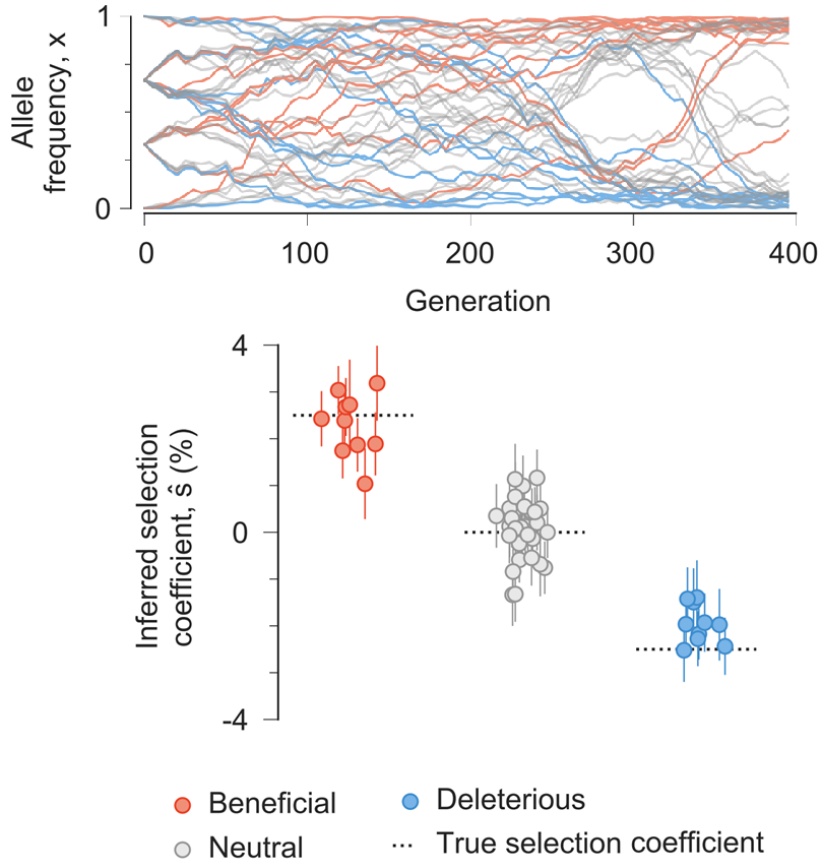
Marginal path likelihood (MPL) estimate

- Evolutionary path $X = \{\underline{x}(t_0), \underline{x}(t_1), \ldots, \underline{x}(t_K)\}$
- Path integral --- probability of the evolutionary path $P(X|s)$
- Maximum a posteriori solution

$$\widehat{s_i} = \sum_{j=1}^{L} \left[\left(\sum_{k=0}^{K-1} C(t_k)\Delta t \right) + \gamma I \right]_{ij}^{-1} \left[x_j(t_K) - x_j(t_0) - \mu \sum_{k=0}^{K-1} \Delta t (1 - 2x_j(t_k)) \right]$$

Linkage effects | Change in frequency | Mutational flux

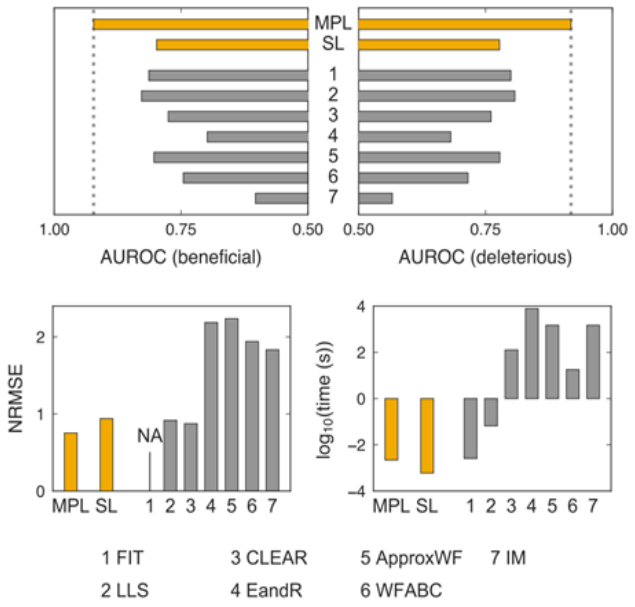


Simulated data: **50-site system**

M. S. Sohail, R. H. Y. Louie, M. R. M., and J. P. Barton, "Resolving genetic linkage reveals patterns of selection in HIV-1 evolution", https://www.biorxiv.org/content/10.1101/711861v1

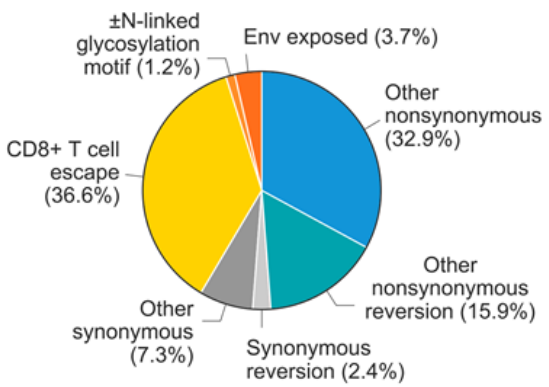
Results

Comparison with other methods

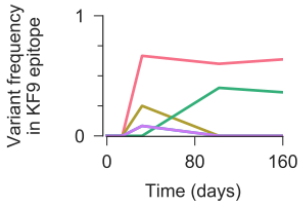


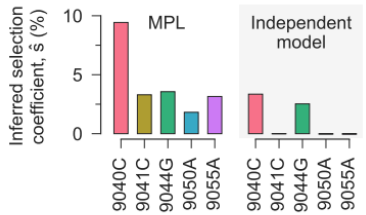
Simulated data: **50-site system**

Analysis of HIV half-genome longitudinal data of 14 individuals

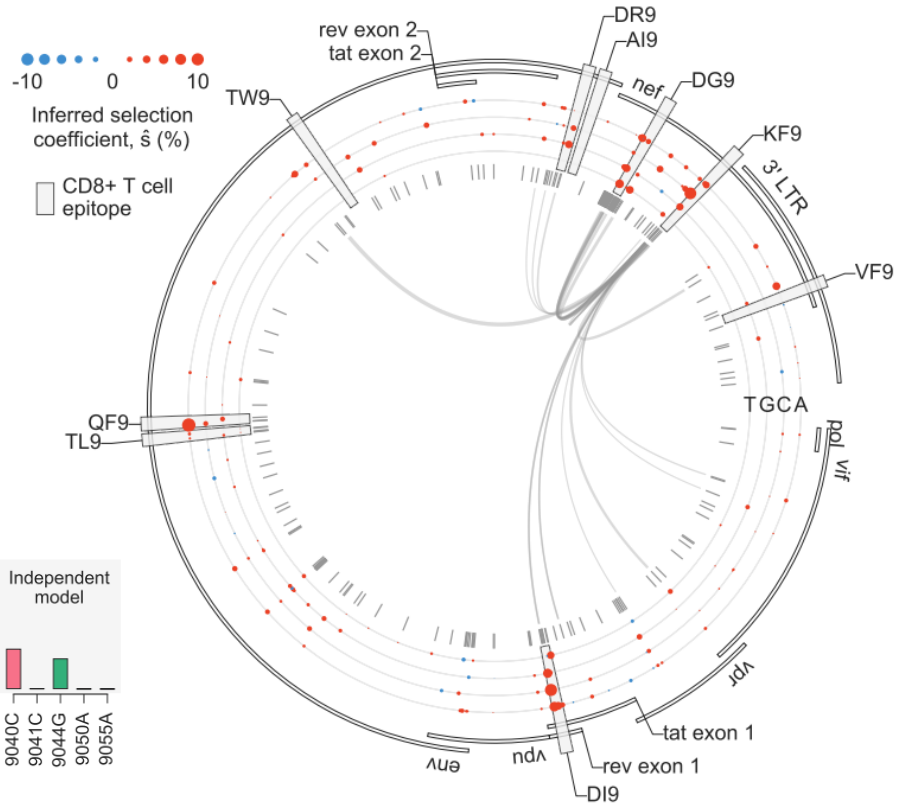


Patterns of **strong selection:**
Top **1%** selection coefficients





Clonal interference in **KF9** epitope of patient **CH77**



Linkage patterns in patient **CH77**
